

Project Work in DA598A: Generative AI

Project Goals

1. To explore and investigate how the knowledge you acquired in the course can be applied. E.g., models for generation of image/text/speech, large language models (LLM), agentic AI, etc.
2. To develop generic and advanced skills in the use of popular Generative AI models, tools and platforms.
3. To implement a Generative AI solution with a potential for a real-world application scenario.

General Requirements

- Students can do the project in groups. It is highly desired that students gain experiences on teamwork in developing/implementing/ software projects.
- It is recommended that the group member size is not more than 3. Large group sizes are undesirable as it is difficult to manage the contributions of individual members and integrate the final product.
- Each group is expected to develop project plans.
- You propose and submit a relevant project topic and title in your area of interest. Your project work could be a real-world application, or a simulation based on existing or anticipated scenarios.
- Before proceeding with the implementation, your proposal should be approved in week41. You will receive feedback (comments and amendments) on your proposal.

Project Specific Features

- We need to cover additional topics in natural language processing (NLP) and large language models (LLM) so that you can be able to refine your project scope and goals.
- Additional details on implementation plan and evaluation criteria will be provided as we cover new concepts in Week 40 and 41.
